# **ADDITIONAL MATERIALS**

In addition to this examination paper, you will need:

- · a calculator;
- an 8 page answer book;
- a copy of the **Periodic Table** supplied by WJEC. Refer to it for any **relative atomic masses** you require.

### **INSTRUCTIONS TO CANDIDATES**

Use black ink or black ball-point pen.

Write your name, centre number and candidate number in the spaces at the top of this page.

Section A Answer **all** guestions in the spaces provided.

Answer both questions in Section B in a separate answer book which should then Section B

be placed inside this question-and-answer book.

Candidates are advised to allocate their time appropriately between **Section A (40 marks)** and Section B (40 marks).

#### INFORMATION FOR CANDIDATES

The number of marks is given in brackets at the end of each question or part-question.

The maximum mark for this paper is 80.

Your answers must be relevant and must make full use of the information given to be awarded full marks for a question.

You are reminded that marking will take into account the Quality of Written Communication in all written answers.

### **SECTION A**

Answer all questions in the spaces provided.

- 1. Ammonium salts are very important chemicals as they are used as a nitrogen source in fertilisers.
  - (a) When cold aqueous sodium hydroxide is added to an ammonium salt, the following equilibrium exists.

$$NH_4^+(aq) + OH^-(aq) \rightleftharpoons NH_3(aq) + H_2O(I)$$

Identify the two acid-base conjugate pairs in the equilibrium.

nitrogen gas. This can be represented by the ionic equation:

[2]

(b) Ammonium chloride and sodium nitrite react together in aqueous solution to produce

$$NH_4^+(aq) + NO_2^-(aq) \longrightarrow N_2(g) + 2H_2O(I)$$

The rate equation for the reaction is given below.

Rate = 
$$k[NH_4^+][NO_2^-]$$

(i) Complete the table of data for the above reaction. All experiments were carried out at the same temperature. [3]

|   | [NH <sub>4</sub> <sup>+</sup> (aq)]/mol dm <sup>-3</sup> | [NO <sub>2</sub> <sup>-</sup> (aq)]/mol dm <sup>-3</sup> | Initial rate/mol dm <sup>-3</sup> s <sup>-1</sup> |
|---|--|--|---|
| 1 | 0.200  | 0.010  | 4.00 × 10 <sup>-7</sup>                           |
| 2 |  | 0.010  | 2.00 × 10 <sup>-7</sup>                           |
| 3 | 0.200  |  | 1.20 × 10 <sup>-6</sup>                           |
| 4 | 0.100  | 0.020  |   |

(ii) Calculate the value of the rate constant, *k*, giving its units.

[2]

Value of k = .....

Units .....

3. Read the passage below and then answer the questions in the spaces provided.

# **Hydrogen Peroxide**

If a non-scientist knows only one chemical formula it is most likely to be  $H_2O$  for water but how much do you know about another hydrogen oxide, hydrogen peroxide? A molecule of hydrogen peroxide has the molecular formula  $H_2O_2$ .

Most chemistry students first meet hydrogen peroxide as a colourless solution that is used to prepare oxygen. Bottles of hydrogen peroxide from a pharmacist are often labelled '20 volume'. This means that one volume of solution decomposes to give 20 volumes of oxygen gas. The equation for the decomposition is:

$$2H_2O_2(aq) \longrightarrow 2H_2O(I) + O_2(g)$$
  
 $1 dm^3$   $20 dm^3$ 

This reaction is very slow at room temperature. However the addition of a suitable catalyst increases the rate of decomposition phenomenally. Manganese(IV) oxide, potatoes and blood are all effective. Potatoes and blood both contain the enzyme catalase and one catalase molecule decomposes 50 000 molecules of H<sub>2</sub>O<sub>2</sub> per second!

Is hydrogen peroxide an oxidising agent or a reducing agent?

Both in the laboratory and at home hydrogen peroxide is most commonly used as an oxidising agent (so the hydrogen peroxide itself is reduced). The half-equation is:

Reduction 
$$H_2O_2 + 2H^+ + 2e^- \longrightarrow 2H_2O$$

Since some colouring matter is bleached by oxidation and the product of hydrogen peroxide's reduction is water, it is used as a safe bleaching agent particularly in hair treatment. A peroxide blonde is someone with almost white hair, usually as a result of treatment with hydrogen peroxide.

However, if hydrogen peroxide reacts with a more powerful oxidising agent such as potassium manganate(VII), the hydrogen peroxide will act as a reducing agent and will itself be oxidised. The half-equation is:

Oxidation 
$$H_2O_2 \longrightarrow 2H^+ + O_2 + 2e^-$$

Therefore hydrogen peroxide can act as both oxidising agent and reducing agent. In fact, it can react with itself so that alternate molecules are oxidised and reduced. The overall equation is obtained by adding the half-equations for the reduction and oxidation, giving

$$2H_2O_2(aq) \longrightarrow 2H_2O(I) + O_2(g)$$

which is the standard decomposition equation!

- End of passage -

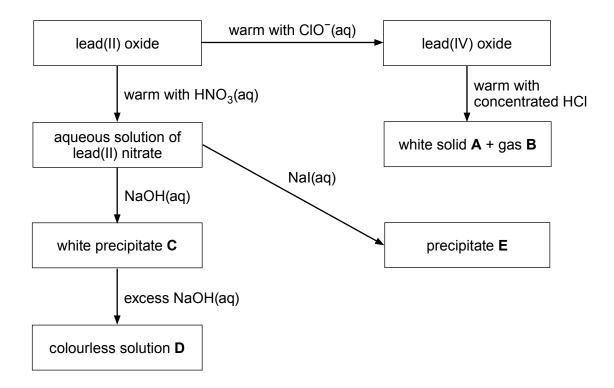

| (a) | Using outer electrons only, draw a dot and cross diagram to show the bonding in a hydrogen peroxide molecule (line 3). [1]   |
|-----|--|
| (b) | Use the equation for the decomposition of hydrogen peroxide ( <i>line 8</i> ) to calculate the concentration, in mol dm <sup>-3</sup> , of aqueous hydrogen peroxide solution in a bottle of '20 volume hydrogen peroxide' at 25 °C. [2]  [1 mol of oxygen occupies 24 dm <sup>3</sup> at 25 °C] |
| (c) | Concentration =  |
|     | (i) Give <b>two</b> reasons why transition metal compounds can act as catalysts. [2]   |
|     | (ii) Explain why transition metal complex ions appear coloured. [4] QWC [1]  |

## **SECTION B**

Answer both questions in the separate answer book provided.

**4.** (a) The diagram shows some of the reactions of lead compounds.

- (i) State the role of lead(IV) oxide in the reaction with concentrated hydrochloric acid. [1]
- (ii) Name white solid **A** and gas **B**. [2]
- (iii) Give the formula of the lead-containing species present in colourless solution **D**. [1]
- (iv) Give the colour of precipitate **E**. [1]
- (v) Write the equation for the formation of lead(II) nitrate from lead(II) oxide. [1]

© WJEC CBAC Ltd. (1095-01) Turn over.

- (b) Carbon is the first element in Group 4. Two of its allotropes are diamond and graphite. A compound that forms structures corresponding to diamond and graphite is boron nitride.
  - (i) Describe the structure of graphite and explain why hexagonal boron nitride can adopt the same structure yet have different electrical conductivity properties. [4]
     QWC [1]
  - (ii) State **one** use for the **cubic** boron nitride structure. [1]
- (c) Another element in Group 4 is tin. At low temperatures tin exists as its grey form. At higher temperatures the white form is stable. The change can be represented by the equation:

$$Sn_{(grey)} \longrightarrow Sn_{(white)} \Delta H^{\oplus} = 1.92 \text{ kJ mol}^{-1}$$

The standard entropy values are 44.8 J K<sup>-1</sup> mol<sup>-1</sup> for grey tin and 51.5 J K<sup>-1</sup> mol<sup>-1</sup> for white tin.

- (i) Calculate the minimum temperature needed to cause grey tin to change to white tin.
- (ii) During Napoleon's disastrous campaign in Russia from June to December in 1812 the tin buttons on his infantry's uniforms disintegrated. Suggest a reason why this might have happened. [1]
- (d) An important technological development in recent years has been the hydrogen fuel cell. This uses electrochemical methods to get energy from hydrogen.
  - (i) Write the half-equations for the processes occurring at the electrodes and an equation for the overall reaction. [3]
  - (ii) Give **one** disadvantage of using hydrogen fuel cells to power vehicles. [1]

Total [20]

- **5.** (a) Chlorine reacts with aqueous sodium hydroxide in one of two ways, depending on the temperature used.
  - (i) Write the equation for the reaction of chlorine with

- (ii) Classify this type of redox reaction. [1]
- (b) Chlorine reacts with many elements to form chlorides. Explain why phosphorus forms two chlorides, PCl<sub>3</sub> and PCl<sub>5</sub>, but nitrogen only forms NCl<sub>3</sub>. [2]
- (c) Most ionic chlorides, e.g. sodium chloride, are soluble in water. However some, e.g. silver chloride, are insoluble.

The enthalpy change of solution of an ionic compound and its solubility depend on the balance between two enthalpy changes. Name these enthalpy changes and state if they are endothermic or exothermic. Explain how the enthalpy change of solution of a compound and its solubility depend on the balance between them.

[4]

QWC [1

(d) Some standard electrode potentials,  $E^{-\Theta}$ , are given below.

| System   | E <sup>⊕</sup> /V |
|--|-------------------|
| $\frac{1}{2}I_2(s) + e^- \rightleftharpoons I^-(aq)$   | +0.54             |
| $Fe^{3+}(aq) + e^{-} \rightleftharpoons Fe^{2+}(aq)$   | +0.77             |
| $\frac{1}{2} \operatorname{Br}_2(I) + e^- \rightleftharpoons \operatorname{Br}^-(\operatorname{aq})$ | +1.09             |
| $\frac{1}{2} \operatorname{Cl}_2(g) + e^- \rightleftharpoons \operatorname{Cl}^-(aq)$                | +1.36             |
| $Ce^{4+}(aq) + e^{-} \rightleftharpoons Ce^{3+}(aq)$   | +1.45             |

- (i) Using the information from the table, state which of the **halides** will reduce Fe<sup>3+</sup> to Fe<sup>2+</sup>. Give a reason for your answer. [2]
- (ii) Write the cell diagram of the cell formed by combining the Fe<sup>3+</sup>(aq), Fe<sup>2+</sup>(aq) and Ce<sup>4+</sup>(aq), Ce<sup>3+</sup>(aq) half cells and calculate the standard e.m.f. of this cell. [2]

#### **QUESTION 5 CONTINUES ON PAGE 12**

© WJEC CBAC Ltd. (1095-01) Turn over.

(e) A flask containing an initial mixture of 0.100 mol of ethanoic acid and 0.083 mol of methanol was kept at 25 °C until the following equilibrium had been established.

CH<sub>3</sub>COOH + CH<sub>3</sub>OH  $\rightleftharpoons$  CH<sub>3</sub>COOCH<sub>3</sub> + H<sub>2</sub>O  $\Delta H = -3 \text{ kJ mol}^{-1}$ 

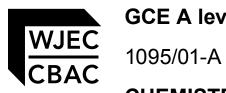

The ethanoic acid present at equilibrium required 32.0 cm<sup>3</sup> of a 1.25 mol dm<sup>-3</sup> solution of sodium hydroxide for complete reaction.

- (i) Write an expression for the equilibrium constant,  $K_c$ , giving the units, if any. [2]
- (ii) Calculate the number of moles of ethanoic acid present at equilibrium. [1]
- (iii) Calculate the value of the equilibrium constant,  $K_c$ , for this reaction. [2]
- (iv) State, giving a reason, what happens to the value of the equilibrium constant,  $K_c$ , if the temperature is increased. [1]
